

DAY 1

Splunk Observability E2

Introduction to Observability and Core Platform Components

Metrics, Traces and Logs from every system, in one place

Day 1 Agenda

What we will cover in today's session

01

What is Observability?

Definition, and why it goes beyond traditional monitoring

02

The Three Pillars

Metrics, Traces and Logs — the raw material of observability

03

Splunk Observability Cloud

Platform overview, purpose and how it fits your stack

04

Platform Architecture

How data flows from your systems into the platform

05

Core Components

Infrastructure Monitoring, APM, RUM, Synthetics, Log Observer

06

Recap & Day 2 Preview

Key takeaways and what's ahead tomorrow

What is Observability?

Understanding system health from the outside, using the data systems produce

Observability is the ability to measure the internal state of a system by examining the data it produces — metrics, traces and logs. Unlike traditional monitoring, which answers questions you thought of in advance, observability lets you ask new questions about issues you never anticipated.

Why Observability Matters

Traditional monitoring vs. modern observability

TRADITIONAL MONITORING

- Relies on pre-defined dashboards and known failure modes
- Answers questions decided in advance
- Alerts on symptoms after thresholds are crossed
- Data lives in separate, disconnected tools
- Effective for known, stable systems

MODERN OBSERVABILITY

- Lets you explore data to answer questions you didn't anticipate
- Built on high-cardinality metrics, traces and logs
- Finds root cause quickly through correlation
- Metrics, traces and logs unified in one platform
- Essential for dynamic, distributed, cloud-native systems

Splunk Observability Cloud

A unified, full-fidelity platform for monitoring modern applications and infrastructure

- Full-fidelity, real-time platform — no sampling, no data loss on ingest
- Built natively on OpenTelemetry, the open industry standard
- Unifies Infrastructure Monitoring, APM, RUM, Synthetics and Log Observer
- Sub-second resolution metrics with unlimited cardinality (NoSample)
- AI-driven detection surfaces anomalies before customers notice

Splunk Observability Suite

Five core components, unified under one platform

Platform Architecture

How data flows from your environment into Splunk Observability Cloud

The OpenTelemetry Collector is the single agent used to gather metrics, traces and logs — eliminating the need for multiple vendor-specific agents on each host.

Component Deep Dive: Infrastructure Monitoring

Real-time visibility into hosts, containers and cloud services

- Streams metrics from hosts, containers, Kubernetes and cloud services in real time
- Sub-second data resolution — see problems as they happen, not minutes later
- Navigator view auto-organizes infrastructure into a live, explorable map
- Built-in dashboards for AWS, Azure, GCP, Kubernetes and 200+ integrations
- Unlimited metric cardinality — filter and group by any tag, on the fly

Component Deep Dive: APM & RUM

Tracing requests through services, and monitoring real user experience

APPLICATION PERFORMANCE MONITORING (APM)

- Distributed tracing follows a single request across every microservice
- Service Map visualizes dependencies and health across the architecture
- Tag Spotlight pinpoints which attribute is driving errors or latency
- Full-fidelity trace ingestion — every trace analyzed, none discarded

REAL USER MONITORING (RUM)

- Captures actual browser and mobile session data from real users
- Measures page load, Core Web Vitals and front-end errors
- Connects front-end sessions directly to back-end traces
- Segments experience by geography, device and browser

Day 1 Recap & Key Takeaways

What we covered, and what's ahead on Day 2

Observability

Goes beyond monitoring by letting you explore metrics, traces and logs to answer unplanned questions

Three Pillars

Metrics, Traces and Logs together give full visibility into system behavior

Splunk Observability Cloud

A single, full-fidelity, OpenTelemetry-native platform for modern environments

Five Core Components

Infrastructure Monitoring, APM, RUM, Synthetics and Log Observer Connect

Coming up on Day 2: Detectors, Alerting, Dashboards and Hands-on Lab
